

COMMISSIONING

Commissioning is often the most dangerous phase for projects.

During this period, isolations are removed, energy sources are applied and equipment is made operational.

Due to the capricious nature of the commissioning process, things don't always go as planned.

Typically machinery will not function as required, installation mistakes will have been made during construction and setpoints, parameters and loops will need to be tuned.

Thorburn Australia engineers have many years of commissioning experience in the field and have encountered all manner of faults, errors and abnormal operation.

We have commissioned projects from small pump stations to major conveyor systems and chemical processes with no safety incidents.

For safe, trouble free operation let us help you commission your next project.
