

## LARGE SCALE SOLAR

Solar networks larger than 30kW require special regulations under the National Electricity Rules.

Typically, businesses wishing to use solar power above 30kW will apply for a non-exporting connection.

This type of connection does not require customers to be classified as a generator and be registered with the Australian Energy Market Operator.

A specific set of conditions are then required by the electricity network operator to ensure the installation will not supply on to the grid.

Compliance checks must be performed for:

- Technical requirements
- Performance standards
- Connection arrangement
- Control & Protection
- Power quality

**Thorburn Australia** has provided audits and compliance checks for our clients to ensure they meet the required standards and can confidently apply for their connection.
